Expanse Roadmap 3

This document will outline the newest roadmap for Expanse and the EXP DAO

Q1 - 2017

Proof of Concept's Modules

Modules are important pieces needed for the Expanse DAO to function. Each module also acts as a stand alone product. Together they make up the Expanse DAO

Identity Management Module

This module is publicly known as Borderless.tech. This module is the central module that everything else is built off of.

Voting Module

This module is a sub module of the Identity management module. Polls and their consequences are an extension of one's identity. The voting module will help the dao determine which proposal to fund.

Proposal Management Module

This module is publically known as EXP.LIFE. This module allows expanse users to create proposals or "quests" for others users to complete. The Expanse DAO will use this module to create and fund proposals for the community.

Gamification Module

This module is a sub module of the EXP.LIFE module. In the Expanse white paper we talk about users earning "Influence" and "Power" for participating in the voting process.

The Expanse Bond System (EBS)

EBS is a new simulated staking system using smart contracts. This system allows people to lock up their own EXP in a smart contract and gain rewards for holding. The rewards in practice for users will be somewhat like staking coins, but without needing to run computers and nodes. Users will simply need to start buy the EBS and then they will gain the rewards automatically.

EBS 6 Month Contract

The first iteration of the Expanse Bond System (EBS) with a limited release has already launched, and on Feb 15th 2017 the next distribution of EBS starts, less limited with 5000 EBS for sale for a total of 500k Expanse. This is with a 6 month contract. That means tokens will be locked up in smart contracts for 6 months and buyers will gain 12% annual rewards paid out every 30 days. At the end of the 6 months it can all be removed from the Smart Contact, or it can remain and the buyer can keep gaining rewards every 30 days, and they can then cancel at any time.

EBS Non Lock Contract

The next version of EBS will be very much like traditional staking with the variables, although this is also a part of EBS and is simulated staking with smart contacts. This upcoming version will only require you to hold EXP as long as you want to gain interest, and every 10 days there will be a payout of 6% annually, and the contracts can be canceled at any time so there is only a requirement to hold EXP in the contracts for as long as people want to gain 6% annually.

Q2 - 2017

MVP for Standalone Version of modules

Each module will have a standalone DAPP that users can consume and give feedback on.

MVP Module Documentation

Complete documentation for developers to integrate the MVP modules into their DAPPS.

Version 1.0 for Expanse DAO

All four modules will be far enough along that we can consider version 1 of the EXP DAO ready to launch and the community can start creating proposals to fund exp projects. Note: The Expanse DAO is likely to launch much sooner than Q2, in case of delays we will keep this as Q2, but don't be surprised if the Expanse DAO launches much earlier.

Delegated Proof of Stake Launch (dPoS)

Tendermint is currently the leading Candidate for dPoS, but we are still testing and looking into the best options for Expanse. dPoS is also being delayed until after the DAO so that the community can directly vote on major decisions like this, or remaining proof of work, or using some other option the community prefers.

Expanse Bond System (EBS) Trading Platform

There has been a great deal of interest in the ability to trade EBS in the Expanse community, so we will build a trading platform for the Expanse Bond System so that people can trade their EBS in a safe and decentralized manner.
